PART A

Foundations

What the finalized MVP is, the principles that shape it, and who uses it.

IN THIS PART

1. MVP Overview & Product Principles
2. Primary User Roles

1. MVP Overview & Product Principles

A specification of the finalized first-stage MVP of the ZenCro School Management System, a K–12 school management platform. It describes what is included, how each part is intended to work, and where the MVP deliberately stops.

1.1 Purpose of this document

This document defines the finalized MVP feature set. It is written so that four groups can use it without needing a separate briefing:

Reader	What they can take from this document
Product designer / UI-UX designer	Which screens and workflows must be designed, what each screen must make clear, and the design principle behind it.
Developer	Which functionality must be built for each module, the rules each workflow follows, and what is deliberately left out.
Team leader / product manager	Exactly what is in the MVP (Section 21) and what is not (Section 22).
Non-technical stakeholder	A plain-language description of each module, with examples of how it is used day to day.

It describes **only** the finalized MVP. It is not a research report, a competitor analysis, a roadmap or a technical architecture document.

1.2 Product direction

FINALIZED MVP FEATURE Product direction

ZenCro School Management System is a K–12 school management platform. Its direction is to make common school-management workflows simpler, clearer, more useful and easier to operate. It differentiates through better execution of common school-management workflows.

The product does not claim to introduce a category that does not exist elsewhere. School attendance, fees, results and parent communication are familiar workflows. The MVP aims to make them easier to run, easier to understand and easier to move into and out of.

1.3 How to read the labels in this document

Four labels are used consistently. They keep requirements, intentions and illustrations clearly apart, so that an example is never mistaken for a rule.

FINALIZED MVP FEATURE
Something included in the first-stage product. Developers build it; designers design it.

DESIGN PRINCIPLE
How a feature should be designed: the intent behind the screens and workflows.

EXAMPLE
An illustration of how a feature could be used. Examples are not mandatory product rules.

MVP LIMITATION
What a feature deliberately does not attempt to cover in the first stage.

1.4 The finalized MVP at a glance

The MVP contains exactly fourteen functional areas. Some are connected internally, but each is described separately so its scope is unambiguous.

01 School Setup
School profile, academic year, board/curriculum, classes, sections, subjects, users, roles, permissions.

02 Student Management
Student records and Student 360, the consolidated view of a student.

03 Attendance Management
Fast daily class attendance, corrections, percentages, reports, parent visibility.

04 Fees Management
Fee structures, dues, payments, receipts, outstanding amounts, reports.

05 Exams & Results
Exams, subjects, marks, grading, results and configurable report cards.

06 Communication
Announcements with audience targeting.

07 Parent Dashboard
A simple, mobile-friendly parent view, including multiple children.

08 PTM
Parent-teacher meeting slots and booking.

09 Basic Forms
Permission, consent, participation and acknowledgement forms.

10 Import, Migration & Data Transfer
A guided workflow to move school data in, with validation and confirmation.

11 Data Export
Permission-controlled, logged export to CSV and Excel.

12 Admin Dashboard
Overview, Needs Attention and Quick Actions.

13 Teacher Dashboard
Today's tasks and pending work.

14 Data & Privacy
Administrator tools and information for data access, management and privacy.

1.5 Module map

The modules fit together in four layers. Foundation data is entered or imported once and then reused across daily workflows and dashboards.

FOUNDATION	**School Setup** | **Student Management** | **Import, Migration & Data Transfer**
DAILY OPERATIONS	**Attendance** | **Fees** | **Exams & Results** | **PTM** | **Basic Forms** | **Communication**
VIEWS AND DASHBOARDS	**Admin Dashboard** | **Teacher Dashboard** | **Parent Dashboard**
DATA STEWARDSHIP	**Data Export** | **Data & Privacy**

1.6 Product principles

The MVP is shaped by the principles below. Each is a DESIGN PRINCIPLE: it guides decisions across modules.

Principle	What it means in the MVP
Simplicity	Each workflow is reduced to the steps a person actually needs. Common tasks take few steps.
Clarity	Screens say plainly what is happening: what is owed, what is pending, what has changed.
Good UI/UX	Clean layouts, clear hierarchy, obvious primary actions, readable on a phone and a desktop.
Reduced administrative effort	Teachers and administrators should not repeat work. Enter once; reuse everywhere.
Easy navigation	Related information is reachable from where the person already is (for example from a student record).
Useful dashboards	Dashboards show what needs doing, not only statistics.
Clear data presentation	Numbers and status are shown in context, with meaning, avoiding unnecessary charts.
Reliable workflows	Workflows behave predictably. Imports confirm before saving; payments produce receipts.
Easy migration	Moving existing school data in is a guided workflow, not a bare file upload.
Easy data export	Schools can take their data out in common formats.
Configurable school-specific academic and reporting requirements	Report cards adapt to a school's board/curriculum and academic levels through bounded configuration.

1.7 Scope rules for this document

- The product is for **K–12 schools**. College and university ERP is out of scope.
- Only the fourteen functional areas above are in the MVP. Examples are illustrations, never requirements.
- Section 22 lists what is not part of this MVP: not in the first-stage scope, not a statement that it can never exist.

2. Primary User Roles

The MVP is built around five primary roles. Every screen and permission in this document refers to them.

School Admin
Sets up and runs the school workspace: configuration, users, student records, imports and exports, announcements, PTMs and forms.

Principal
Oversight: views records, attendance, results and dashboards, and communicates with the school community.

Teacher
Daily classroom work: takes attendance, enters marks, views relevant student information within permitted scope, handles PTM slots.

Accountant
Fee administration: fee structures, assignment, payment recording, receipts and fee reports.

Parent
Views their own linked child or children: attendance, fees, receipts, results, announcements; books PTM slots; responds to forms.

Student is not a login role in the MVP. A student appears as a record, and "students" can appear as an announcement audience.

2.1 Default access intent by module

The table shows the intended default access for each role. Actual permissions are set per school through Roles and Permissions in School Setup, so a school can adjust them within what the product supports. Where a detail is not settled, it is flagged as a design decision.

Module	School Admin	Principal	Teacher	Accountant	Parent
School Setup	Manage	View	-	-	-
Student Management / Student 360	Manage	View	View within permitted scope	View fee-related details	Own linked child only
Attendance	Manage, correct	View	Enter and correct for own classes	-	View own child
Fees	Manage	View	-	Manage	View own child
Exams & Results	Manage	View	Enter marks for own subjects	-	View own child's results
Report cards	Configure, generate	View	-	-	Availability to parents: design decision
Communication	Publish	Publish	View; publishing per permission	-	View
PTM	Create, manage	View	Create, define own slots	-	Book slot
Basic Forms	Create, view responses	View responses	Per permission	-	Respond
Import, Migration & Data Transfer	Manage	-	-	-	-
Data Export	Export	-	-	Fee data, per permission	-
Dashboards	Admin Dashboard	Overview, per permission	Teacher Dashboard	-	Parent Dashboard
Data & Privacy	Authorized administrators	-	-	-	-

DESIGN PRINCIPLE Least access needed

Each role sees what it needs for its job and nothing more. Teachers are limited to their permitted scope. Parents are strictly limited to their own linked children.

PART B

Setup, Students, Attendance, Fees and Exams

The foundation records and the daily academic and financial workflows.

IN THIS PART

3. School Setup
4. Student Management & Student 360
5. Attendance Management
6. Fees Management
7. Exams & Results
8. Configurable Report Card System

3. School Setup

PURPOSE
Give each school one place to describe itself, its academic structure and its people, so every other module has a correct foundation to work from.

What the feature does

School Setup lets the School Admin configure the school's identity, academic year, board/curriculum information, classes, sections, subjects, users, roles and permissions. Each school operates as its own organization (its own workspace): its data and configuration belong to that school.

PURPOSE
Everything else in the product depends on School Setup. Students belong to classes and sections; attendance, fees, exams and parent access depend on students; dashboards summarize all of it.

FINALIZED MVP FEATURE Main MVP features

School name The school's name as shown across the product and on report cards.	**School logo** The logo used in the product and available to report-card templates.	**Address and contact information** School address and contact details, available to report cards and communication.
Academic year The academic period to which classes, fees, exams and results belong.	**Board / curriculum information** The board or curriculum the school follows, used to help determine available report-card configuration.	**Classes** The classes the school runs.
Sections Sections within each class.	**Subjects** The subjects taught, attached to classes.	**Users** The people who use the system: staff and parents.
Roles The five primary roles.	**Permissions** What each role is allowed to see and do.	

3.1 The school as its own workspace

Each school is a separate organization inside the product. A school's students, staff, fees, results and settings are held within its own workspace. Users belong to a school and see only that school's data, according to their role.

3.2 The dependency chain

School Setup comes first because later modules cannot work without it. The diagram shows the dependency.

DEPENDENCY FLOW

3.3 What is configured, and where it is used

Setup item	What the admin provides	Used by
School name, logo, address, contact	Basic identity and contact details	Report cards, announcements, parent view
Academic year	The current academic period	Enrolment, fees, exams, results, attendance
Board / curriculum	The board or curriculum information	Report-card configuration (Section 8)
Classes and sections	Class names and their sections	Student placement, attendance, fees, exams, announcements, PTM
Subjects	Subjects and where they apply	Exams, marks entry, report cards
Users, roles, permissions	Who can sign in and what they can do	Every module; dashboards; data protection

How it works

1. The School Admin creates the school and enters its name, logo, address and contact information.
2. The admin creates the academic year and enters the board/curriculum information.
3. The admin creates classes and their sections, then subjects.
4. The admin adds users and assigns each a role; permissions follow the role and can be adjusted.
5. The admin adds students, by import (Section 13) or by adding them directly (Section 4).

Primary users: School Admin (configures). Principal (views).

EXAMPLE
ABC Public School creates the academic year 2026–27, selects CBSE as its board, creates Classes 1 to 12, adds sections A and B to each class, adds subjects, invites teachers, an accountant and the principal, and then imports its students. Names and structure are illustrative.

DESIGN PRINCIPLE UX / Design principle
Setup should feel like a short guided checklist, not a long form. The admin should always see what is done and what is still needed before the school can start using attendance, fees and exams.

MVP LIMITATION MVP boundary
No advanced timetable management. No advanced board-specific automation. Board/curriculum information helps determine available configuration; it does not apply a board's detailed academic rules automatically.

4. Student Management & Student 360

PURPOSE
Keep one accurate record for each student and give authorized users a single, consolidated view of that student, so they do not need to move between modules to see the whole picture.

What the feature does

Student Management holds the basic student record. Student 360 builds on it by bringing together a student's important operational information (attendance, fees, results, forms, PTM and recent activity) on one screen.

FINALIZED MVP FEATURE Main MVP features

Student ID / admission ID
A unique identifier for the student within the school.

Name
The student's name.

Date of birth
Date of birth.

Gender
Gender as recorded by the school.

Class and section
Where the student is placed for the academic year.

Parent / guardian details
Linked parents or guardians. A guardian can be linked to more than one student.

Contact information
Contact details for the student's family.

Student status
The student's current status in the school.

Basic documents
Basic documents where applicable.

Student 360
The consolidated student view described below.

How it works

1	A student is added by the admin directly or through import (Section 13).
2	The admin places the student in a class and section and links their parent or guardian.
3	Parent access is created through the linked guardian, so a parent sees only their own children.
4	Attendance, fees, results, forms and PTM bookings attach to the student as they happen.
5	Authorized users open Student 360 to see everything about that student in one place.

Primary users: School Admin (manages). Principal (views). Teacher (relevant information within permitted scope). Accountant (fee-related details). Parent (own linked child only).

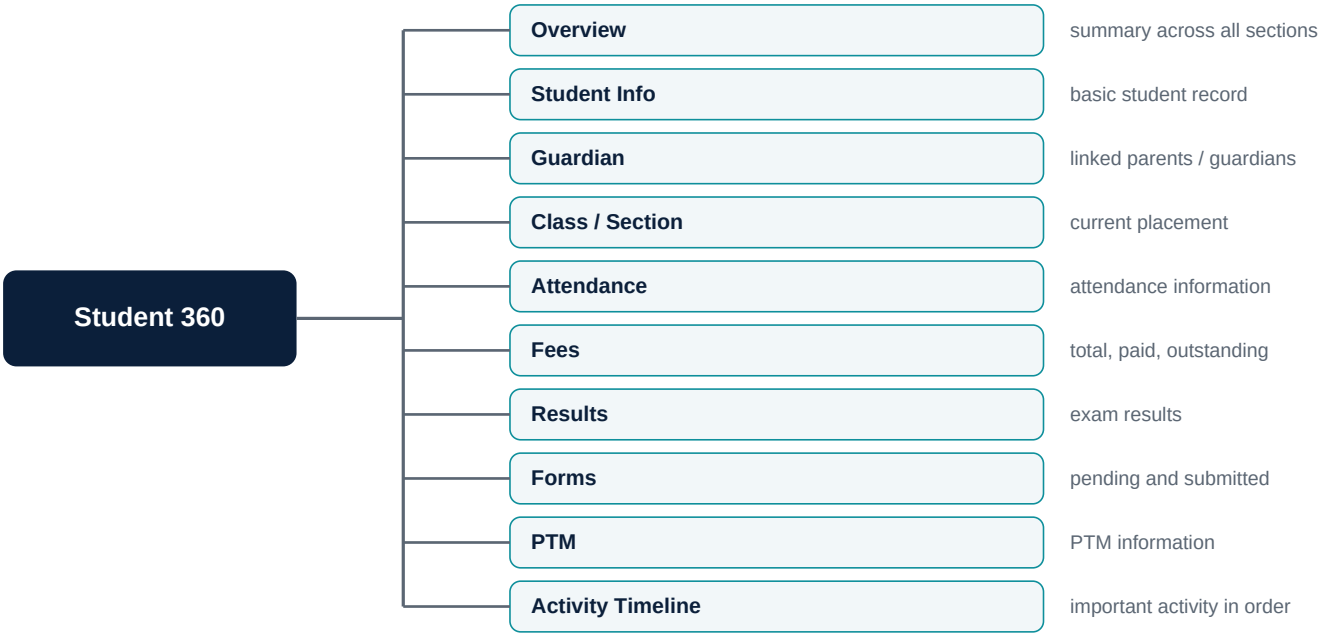

DESIGN PRINCIPLE UX / Design principle
Student information is the center of the product. A person who is looking at a student should never have to remember which module holds which fact.

4.1 Student 360

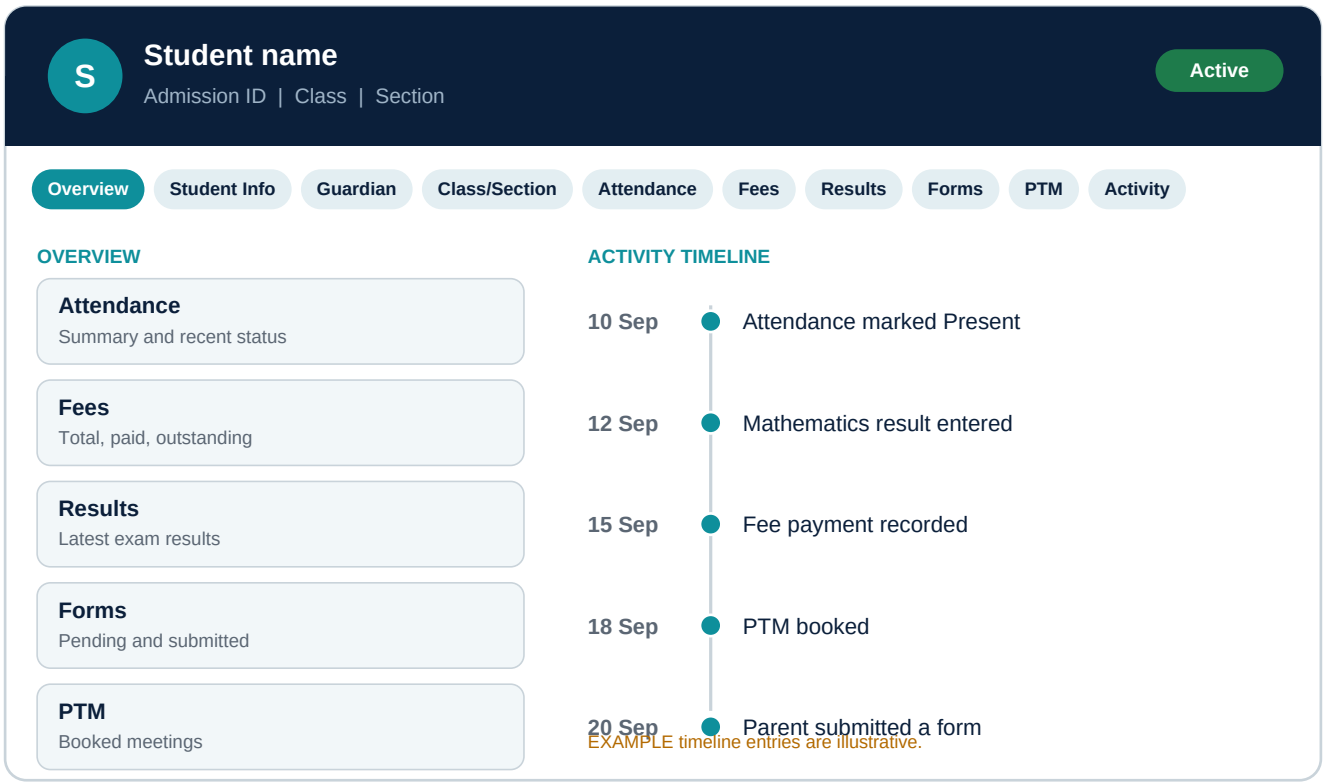

FINALIZED MVP FEATURE Finalized MVP enhancement
Student 360 provides one consolidated operational view of a student's important information, instead of forcing users to navigate through multiple modules.

Student 360 is a view, not a separate database. It reads from the same attendance, fees, results, forms and PTM records that the individual modules use. It adds no new student analytics.

STUDENT 360 STRUCTURE

Concept layout

Section	What it shows	Comes from
Overview	A short summary drawn from the sections below, so the user sees the picture at a glance.	All sections
Student information	ID, name, date of birth, gender, status, basic documents.	Student Management
Guardian information	Linked parents or guardians and contact details.	Student Management
Class / section	Current class and section.	School Setup, Student Management
Attendance	Attendance record and percentage for the student.	Attendance Management
Fees	Total fee, paid and outstanding; payment history and receipts.	Fees Management

Section	What it shows	Comes from
Results	Exam results entered for the student.	Exams & Results
Forms	Forms issued to the parent and the responses given.	Basic Forms
PTM information	PTM slots booked for the student.	PTM
Activity timeline	Important activity in date order.	All of the above

The activity timeline

The timeline lists important events about a student in date order, so a user can quickly see what has happened.

EXAMPLE Example timeline (illustrative entries)

- 10 Sep — Attendance marked Present
- 12 Sep — Mathematics result entered
- 15 Sep — Fee payment recorded
- 18 Sep — PTM booked
- 20 Sep — Parent submitted a form

Who sees what

Role	Student 360 access
School Admin	Can view and manage the full Student 360.
Principal	Can view Student 360.
Teacher	Can view relevant student information within permitted scope, for example students in their own classes.
Accountant	Can view fee-related details needed for fee work.
Parent	Sees only their own linked child’s information. With more than one child, the parent switches between children (Section 10).

MVP LIMITATION MVP boundary

Student 360 does not include sensitive student analytics, scoring, risk flags or predictions. It consolidates records that already exist in the MVP modules. The exact student status values and the list of basic documents are design decisions to confirm.

5. Attendance Management

PURPOSE
Let teachers record attendance in the least possible effort, and make attendance information immediately useful to authorized users.

What the feature does

Teachers record daily attendance for their class and section. Authorized users can correct entries, see attendance percentages and basic reports, and parents can see their own child's attendance.

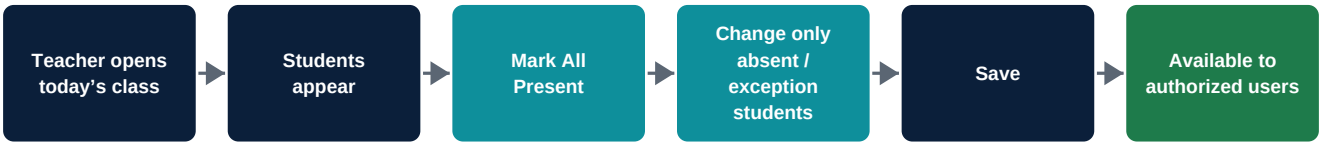

FINALIZED MVP FEATURE Main MVP features

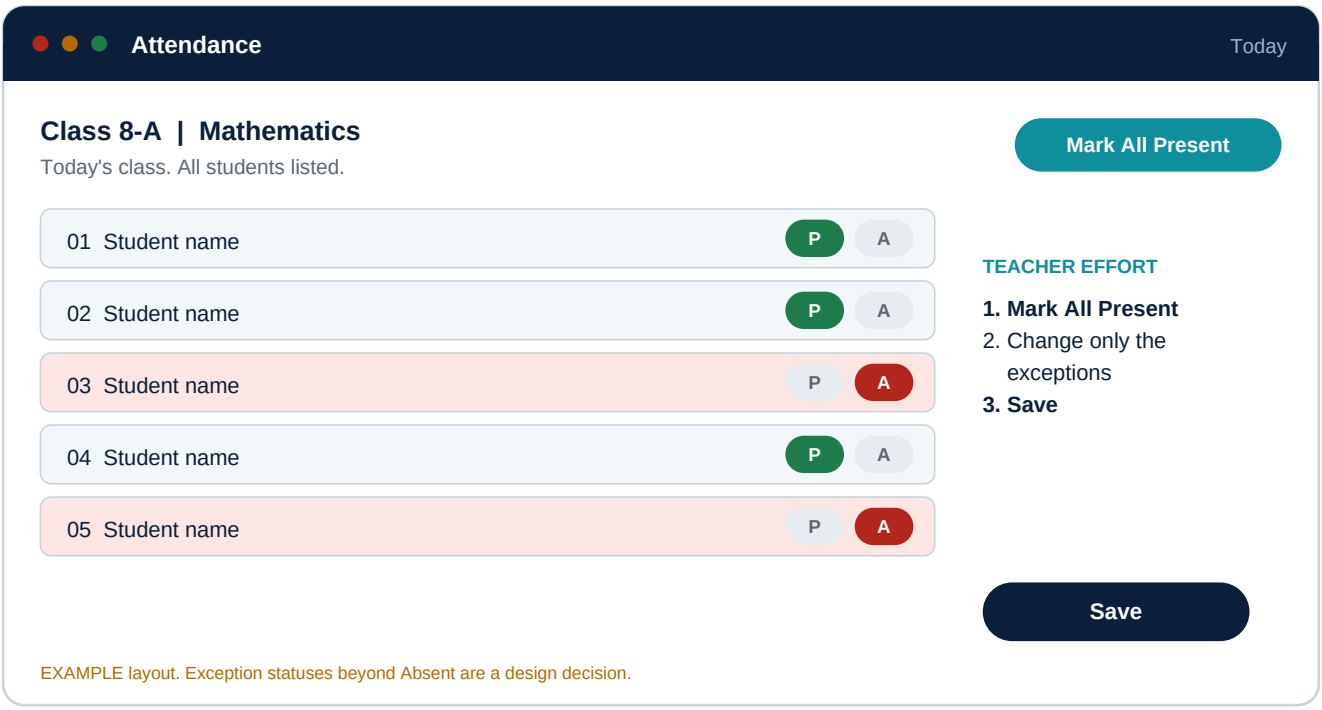

Daily attendance Attendance recorded each school day.	**Class / section attendance** Attendance taken for a class and section.	**Teacher attendance entry** The teacher records attendance for their own class.
Edit / correction A correction workflow for entries that need to change.	**Attendance percentage** Calculated from recorded attendance.	**Basic attendance reports** Basic views of attendance by class, section and student.
Parent visibility A parent sees their own child's attendance.	**Basic notification** A basic notification capability where applicable.	**Selected offline capture** Basic offline attendance capture, only if technically validated.

5.1 The teacher workflow

The teacher workflow must be extremely simple. The goal is to remove repetitive work: most students are present, so the teacher starts from "present" and changes only the exceptions.

ATTENDANCE ENTRY FLOW

How it works

1	The teacher opens the class for today from the Teacher Dashboard or the attendance screen.
2	All students in the class and section appear.
3	The teacher selects Mark All Present, then changes only the students who are absent or exceptions.
4	The teacher saves. The record becomes available to authorized users, including the parent of each student.
5	If an entry is wrong, an authorized user corrects it through the correction workflow.
6	Attendance percentages and basic reports update from the recorded attendance.

5.2 Parent visibility and notification

A parent sees their own child’s attendance on the Parent Dashboard. Basic notification means a basic in-product notification capability where applicable. Email, SMS, WhatsApp and push notification integrations are not part of this MVP.

5.3 Offline attendance capture

MVP LIMITATION MVP boundary

Selected, basic offline attendance capture is included only if it is technically validated. The MVP does not claim robust offline synchronization. If it is validated, the intended behavior is: attendance recorded without a connection is kept on the device and sent when the connection returns, with the teacher able to see whether it has been sent. If it is not validated, attendance remains an online workflow.

EXAMPLE Example

A teacher records Class 8-A attendance, marks everyone present, changes two students to absent, and saves. Later that day the principal opens attendance and sees the class as marked.

DESIGN PRINCIPLE UX / Design principle

Minimize taps. The default is "present"; only exceptions need action. The screen should make it obvious which students have been changed and whether attendance has been saved.

MVP LIMITATION MVP boundary

Which exception statuses exist besides Absent (for example late or leave), and who may correct which entries, are design decisions to confirm. No attendance analytics beyond percentage and basic reports.

6. Fees Management

PURPOSE
Make fee administration extremely clear and simple for accountants and administrators, and make fee status clear to parents.

What the feature does

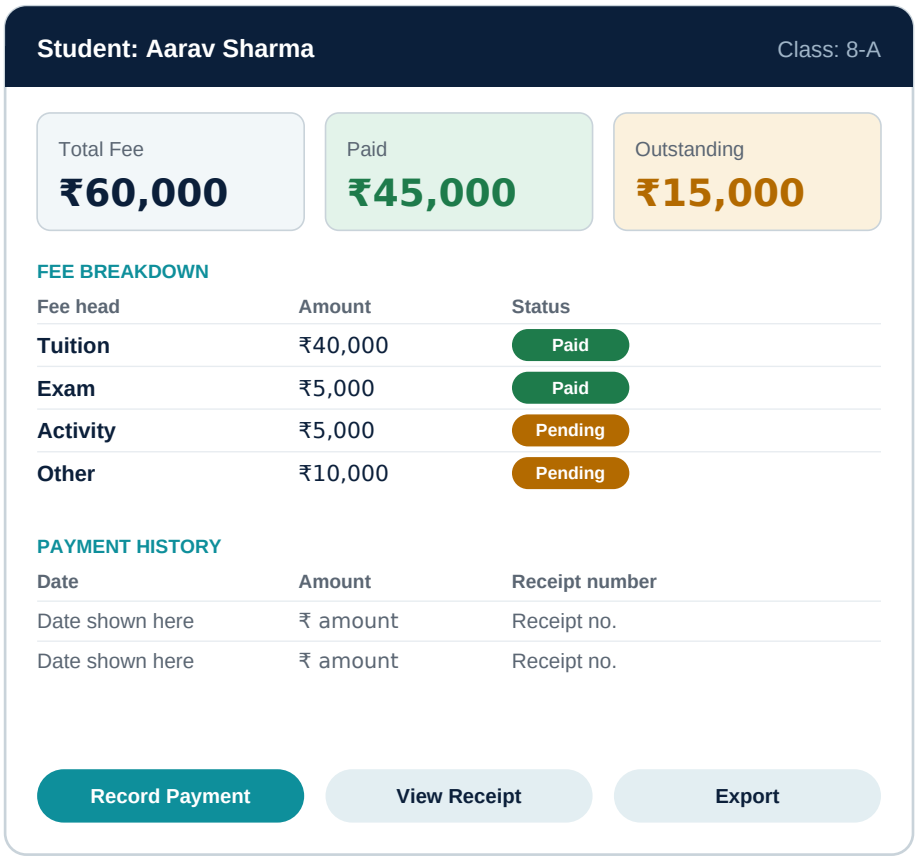

Fees Management lets the school define fee categories and structures, assign fees to students, track dues, record full and partial payments, issue receipts, see what is outstanding, produce collection reports, and carry out basic reconciliation. Parents can see their child's fee status.

FINALIZED MVP FEATURE Main MVP features

Fee categories The types of fee, such as tuition or exam fees.	**Fee structures** The amounts that apply to a class for an academic year.	**Fee assignment** Applying the fee structure to students.
Student dues What each student owes.	**Full payment** Recording a payment that settles the due.	**Partial payment** Recording a payment that settles part of the due.
Payment recording Recording each payment received by the school.	**Receipts** A receipt for each recorded payment.	**Outstanding amount** The amount still to be paid.
Collection reports Reports of what has been collected.	**Basic reconciliation** A basic check that dues, payments and receipts agree.	**Parent fee visibility** Parents see their own child's fee status and receipts.

6.1 The fee view

DESIGN PRINCIPLE Main UX goal
Extremely clear and simple fee management. The fee screen leads with three numbers (total, paid, outstanding), then the breakdown by fee head, then the payment history. The interface prioritizes clarity over information density.

WHAT THIS SCREEN SHOWS

Three numbers first: total, paid, outstanding.

Then the fee breakdown, one line per fee head.

Then payment history with receipt numbers.

Primary action is obvious: Record Payment.

Clarity over information density.

EXAMPLE only; values are illustrative.

EXAMPLE Example (illustrative amounts)

- Student: Aarav Sharma, Class 8-A
- Total Fee ₹60,000 | Paid ₹45,000 | Outstanding ₹15,000
- Tuition ₹40,000 — Paid | Exam ₹5,000 — Paid | Activity ₹5,000 — Pending | Other ₹10,000 — Pending
- Payment history: Date, Amount, Receipt number. Actions: Record Payment, View Receipt, Export.

6.2 Fee flow

FEE FLOW

How it works

1	The accountant or admin defines fee categories and a fee structure for each class.
2	Fees are assigned to students, which creates each student's dues.
3	The accountant opens a student and sees total, paid and outstanding.
4	The accountant records a payment, full or partial, and a receipt is generated.
5	The outstanding amount updates. The parent sees the updated status and receipt.
6	The Admin Dashboard reflects fee collection and outstanding amounts; the accountant can run collection reports and basic reconciliation.

Basic reconciliation helps the accountant confirm that recorded dues, payments and receipts agree, so differences can be found and fixed. The exact views are a design detail. **Primary users:** Accountant, School Admin, Principal (views), Parent (own child).

MVP LIMITATION MVP boundary

The MVP records payments received by the school; it does not describe online payment collection. Reports are collection and outstanding reports, not accounting.

7. Exams & Results

PURPOSE
Let schools record assessment results accurately and turn them into results and report cards without re-entering information.

What the feature does

Authorized users create examinations, define the subjects assessed, enter marks, apply the school's grading, view results and generate report cards. Report cards are covered in depth in Section 8.

FINALIZED MVP FEATURE Main MVP features

Create examinations Define an examination for classes in an academic year.	**Define subjects** Choose the subjects assessed in an examination.	**Enter marks** Teachers enter marks for their subjects and classes.
Grading Apply the school's configured grading approach.	**Results** View results per student, class and examination.	**Report cards** Generate report cards from results (Section 8).

EXAM-TO-REPORT-CARD FLOW

How it works

1	The admin creates an examination and defines the subjects for the relevant classes.
2	Teachers enter marks for the subjects and classes assigned to them.
3	Grading is applied according to the school's configuration.
4	Results are available to authorized users; parents see their child's results.
5	The admin generates report cards using the applicable report-card profile and template.

Primary users: School Admin, Teacher, Principal, Parent.

EXAMPLE Example
A Class 8-A teacher opens the Mathematics marks entry for the term examination, enters each student's marks, and saves. The Teacher Dashboard no longer shows marks entry as pending.

DESIGN PRINCIPLE UX / Design principle
Marks entry should be quick and forgiving: students listed clearly, easy to move between entries, with entry status visible so nothing is left pending by accident.

MVP LIMITATION MVP boundary
Grading follows the school's configuration. ZenCro does not claim to automatically implement every board's official grading rules.

8. Configurable Report Card System

A major part of this specification. Report cards differ by board, by academic level and by school. The MVP handles this through bounded, configurable structure, not one rigid format and not an attempt to encode every board rule.

8.1 The problem

K–12 covers very different academic levels. A pre-primary child is usually described through development and observations, a primary class through marks, grades or remarks, a secondary class through marks, grades, attendance and results, and a higher-secondary class through subject-specific assessment that may differ by stream. Schools also follow different boards or curricula.

A single universal report-card format therefore does not fit K–12. At the same time, the MVP should not hard-code every rule of every board, because that would make the product heavy, brittle and dependent on assumptions that may not match a given school.

FINALIZED MVP FEATURE Finalized MVP approach

Board / Curriculum + Academic Level + Configurable Template

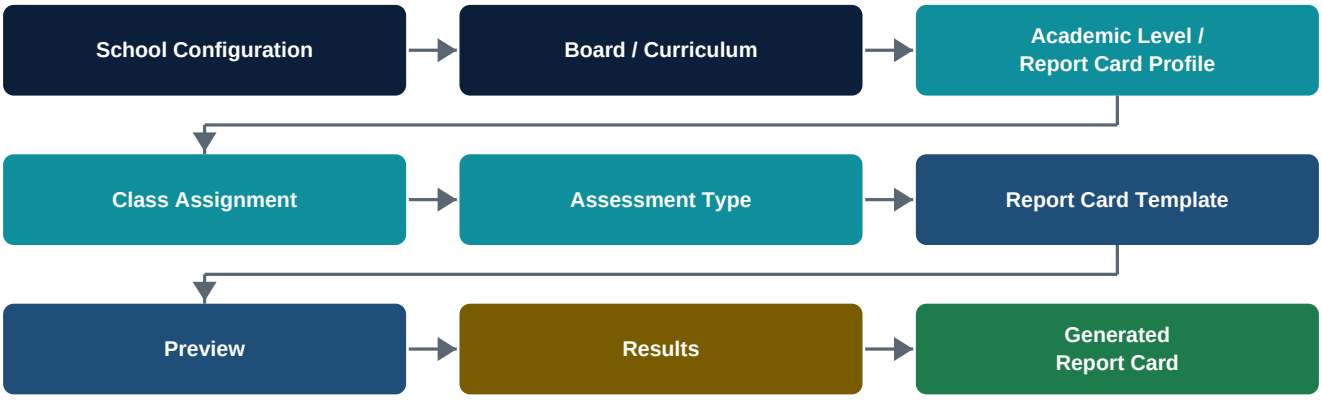

8.2 The three layers

THREE-LAYER MODEL

8.3 End-to-end pipeline

REPORT-CARD PIPELINE

8.4 Layer 1: School configuration

During School Setup the admin configures the school name, logo, academic year, board/curriculum and school information. Examples of board/curriculum selections are CBSE, Maharashtra State Board, or other applicable curriculum.

DESIGN PRINCIPLE Important

Board selection helps determine the available configuration and templates. It does not automatically assume every detailed academic rule of that board.

8.5 Layer 2: Academic level / report-card profile

A report-card profile describes a group of classes that share the same report-card structure. The MVP supports configurable profiles for four academic levels:

Pre-Primary / Kindergarten
School-configured levels. Developmental assessment, ratings and remarks.

Primary
Example: Classes 1–5. Marks, grades and/or remarks depending on configuration.

Secondary
Example: Classes 6–10. Marks, grades, attendance, remarks and result.

Higher Secondary
Example: Classes 11–12. Subject-specific assessment; possible stream-based structure where applicable.

MVP LIMITATION Not hard-coded
The class ranges above are examples. They are not universal rules and are not hard-coded. The school decides which classes belong to which profile.

EXAMPLE CONFIGURATION: CLASS-TO-PROFILE ASSIGNMENT (ILLUSTRATIVE, NOT UNIVERSAL RULES)

Report-card profile	Classes assigned by the school	Assessment method
Pre-Primary / Kindergarten	School-configured levels	Rating / Level + Remarks
Primary Profile	1 2 3 4 5	Marks + Grades
Secondary Profile	6 7 8 9 10	Marks + Grades + Attendance + Remarks
Higher Secondary Profile	11 12	Subject-specific structure

Class-to-profile assignment is what makes the system adaptable: a school may place classes differently, and ZenCro does not need to know every board's class structure in advance.

8.6 Layer 3: Report-card template

The profile decides **what information** a report card contains. The template decides **how** that information is displayed.

PROFILE

"What information should this level contain?"

- Which assessment type applies
- Which subjects or areas are assessed
- Whether attendance is shown
- Whether remarks are included
- Which classes it applies to

+

TEMPLATE

"How should that information appear?"

- School logo, name and address
- Layout and placement of fields
- Subject-wise table presentation
- Remarks and signature areas
- Other approved school fields

Configurable elements

Element	Notes
School logo, name, address	Taken from School Setup.
Student information, Student ID, class, section	Taken from the student record.
Academic year, examination name	Taken from School Setup and the examination.
Subject-wise marks	When the profile uses marks.
Grades	When the profile uses grades.
Attendance	When the profile includes attendance.
Overall result	When the profile includes an overall result.
Teacher remarks, Principal remarks	When the profile includes remarks.
Signature areas	Areas for signatures on the printed report card.
Other approved school fields	Additional fields approved by the school within the bounded options.

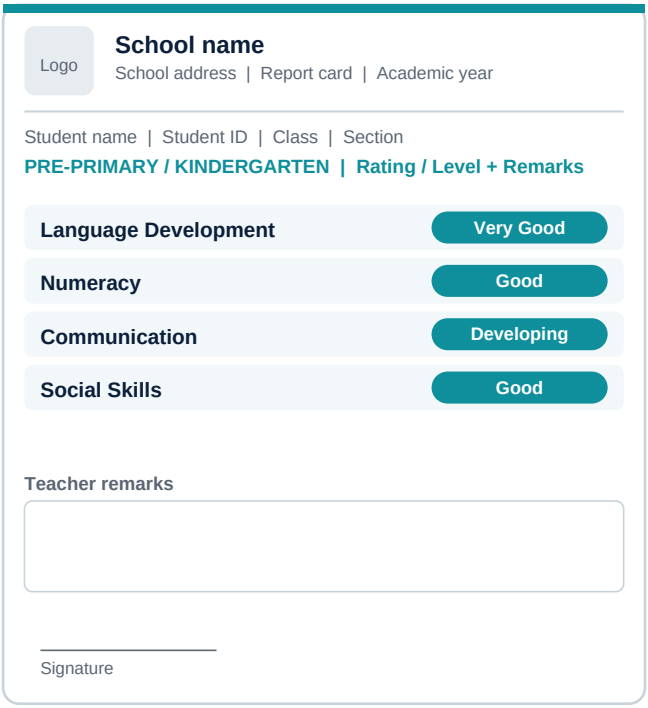

MVP LIMITATION No free-form designer

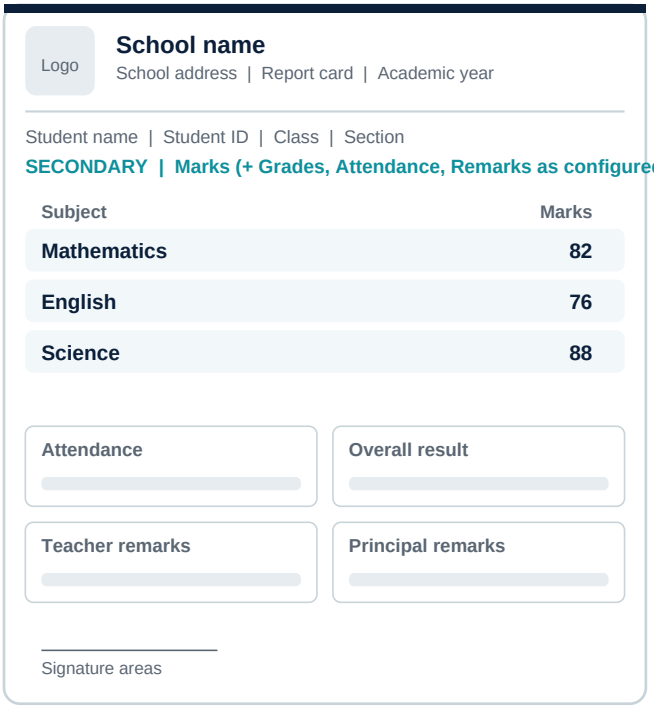

ZenCro does not provide a Canva-style, free-form, drag-and-drop report-card designer in the MVP. Templates use controlled, bounded configuration: a defined set of fields and layout options that the school selects and arranges within limits.

8.7 Assessment types

Each profile uses one configurable assessment type. The assessment type determines what teachers enter and what the report card shows.

Assessment type	What it records	Example (illustrative)
Marks	A numeric mark per subject.	Mathematics — 82
Grades	A grade per subject.	Grade as defined in the school's grading configuration
Marks + Grades	Both marks and grades.	Mathematics — 82, with grade per school grading
Rating / Level	A rating or level per area.	Language Development — Very Good
Remarks	Descriptive remarks.	Short written remark per area or overall

EXAMPLE The two report-card concepts above are illustrations of the same system producing different structures. Pre-primary example areas: Language Development — Very Good; Numeracy — Good; Communication — Developing; Social Skills — Good. Regular-class example: Mathematics 82, English 76, Science 88. Higher secondary uses subject-specific marks or grades based on the school's configured structure.

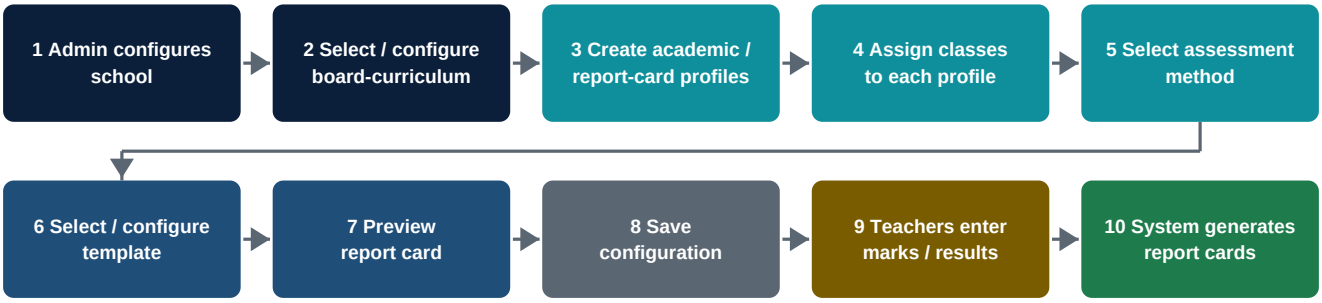

MVP LIMITATION Important

ZenCro does not automatically implement every board's official grading rules. Grading and result logic follow the school's configuration.

8.8 Configuration workflow

The admin configures report cards once per academic setup, then teachers enter results and the system generates report cards from the applicable profile and template.

REPORT-CARD CONFIGURATION WORKFLOW

Step	Who	What happens
1	School Admin	Configures the school: name, logo, academic year, school information.
2	School Admin	Selects or configures board/curriculum information.
3	School Admin	Creates academic / report-card profiles.
4	School Admin	Assigns applicable classes to each profile.
5	School Admin	Selects the assessment method for each profile.
6	School Admin	Selects or configures the report-card template for each profile.
7	School Admin	Previews the report card with the chosen configuration.
8	School Admin	Saves the configuration.
9	Teachers	Enter marks or results for their classes and subjects.
10	System	Generates each report card according to the applicable profile and template.

8.9 Worked example

EXAMPLE Example only

Everything in this section is an illustration of configuration. The names, class ranges and assessment choices below are not requirements.

Item	Configuration (illustrative)
School	ABC Public School
Board	CBSE
Academic year	2026–27
Primary profile	Classes 1–5. Marks + Grades.
Secondary profile	Classes 6–10. Marks + Grades + Attendance + Remarks.
Higher Secondary profile	Classes 11–12. Subject-specific structure.

Generating a report card for Class 8

Generating a report card for Class 11

The same principle applies to every class: the system finds the profile the class is assigned to, applies that profile's template, combines it with the result data, and produces the report card. No class-specific logic is built into the product.

8.10 Design principle

> **"ZenCro's MVP uses bounded report-card configurability rather than attempting to encode every board-specific academic rule."**

This keeps the MVP:

- **Flexible:** schools shape report cards to their own structure.
- **Manageable:** a small set of configurable building blocks, not a rule engine for every board.
- **Easier to build:** one generation mechanism serves every profile.
- **Adaptable:** new schools and class structures need configuration, not new code.
- **Less dependent on assumptions:** the product does not assume how a board's rules apply to a given school.

Specialized board or state workflows can be expanded later, after real school requirements have been validated.

8.11 Report-card scope at a glance

Included in the MVP (FINALIZED MVP FEATURE)	Not attempted in the MVP (MVP LIMITATION)
Board / curriculum configuration Academic-level profiles: Pre-Primary / Kindergarten, Primary, Secondary, Higher Secondary School-assigned class-to-profile mapping Configurable assessment types: Marks, Grades, Marks + Grades, Rating / Level, Remarks Controlled, bounded templates Preview before saving Generation of report cards from results	Free-form drag-and-drop report-card designer Automatic implementation of every board's official grading rules Hard-coded class ranges Advanced board-specific automation Specialized board / state workflows

PART C

Communication, Parents, PTM and Forms

How the school talks to parents, and how parents respond.

IN THIS PART

9. Communication
10. Parent Dashboard
11. PTM
12. Basic Forms

9. Communication

PURPOSE
Give the school one clear place to publish announcements to the right people.

What the feature does

Authorized users publish announcements and choose who should receive them. Recipients view them in the product.

FINALIZED MVP FEATURE Main MVP features

Announcements	Audience targeting	Publish / view announcements
Create an announcement with a title and message.	Choose exactly who the announcement is for.	Publish to the chosen audience; recipients view it in the product.

Possible audiences

Audience	Who receives the announcement
All parents	Every parent or guardian linked to a student in the school.
Specific class	Parents of students in the chosen class.
Specific section	Parents of students in the chosen section of a class.
Teachers	The school's teachers.
Students (as a communication audience, where appropriate)	Students as recipients of a message. Students are not an independent login role in the MVP.

ANNOUNCEMENT FLOW

How it works

1. An admin or principal (or a user with permission) creates an announcement.
2. They choose the audience: all parents, a class, a section, teachers, or students where appropriate.
3. They publish. The announcement becomes visible to the targeted audience only.
4. Parents see announcements on the Parent Dashboard; staff see them in their own views.

EXAMPLE Example
The school publishes a notice about a sports day to Class 5, Section B only. Parents of other classes do not see it.

DESIGN PRINCIPLE UX / Design principle
Targeting should be easy and visible: before publishing, the sender can see who the announcement will reach, so messages are relevant and not broadcast to everyone by default.

MVP LIMITATION MVP boundary
Communication in the MVP is announcements published and viewed in the product. WhatsApp, SMS, email and push-notification integrations are not part of the MVP.

10. Parent Dashboard

PURPOSE
Give parents one simple, mobile-friendly place to see their child's school information and respond to the school.

What the feature does

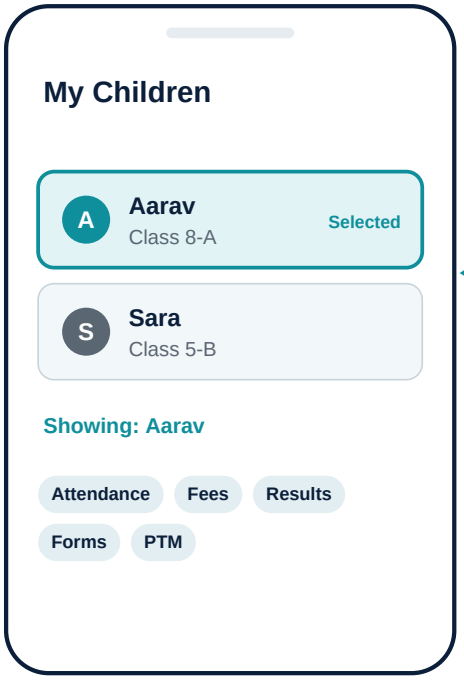

The Parent Dashboard shows a parent their linked child's profile, attendance, fees, receipts, results, announcements, PTM and forms. If a parent has more than one child in the school, they can switch between children within one account.

FINALIZED MVP FEATURE Main MVP features

Child profile Basic information about the child.	**Attendance** The child's attendance and percentage.	**Fees** Total, paid and outstanding, with fee breakdown.
Receipts Receipts for recorded payments.	**Results** The child's results.	**Announcements** Announcements targeted to the parent.
PTM Available slots and booked meetings.	**Forms** Forms to complete and forms already submitted.	**Multi-child switching** Switch between children without separate accounts.

10.1 Multi-child parent view

FINALIZED MVP FEATURE Finalized MVP enhancement
If one parent or guardian has multiple children in the school, the parent can switch between children without separate accounts. Selecting a child changes the attendance, fees, results, forms and PTM information shown. Access remains strictly limited to linked children.

CHILD SELECTOR

One parent account. No separate accounts per child.

Selecting a child changes the view for:

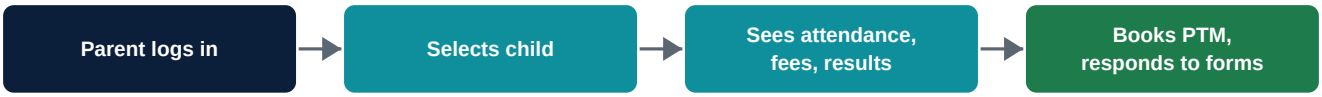

- Attendance
- Fees
- Results
- Forms
- PTM information

Access is strictly limited to linked children.

EXAMPLE: names and classes are illustrative.

Announcements are targeted to the parent through their children's classes and sections, so a parent with children in two classes sees the announcements relevant to either.

PARENT FLOW

How it works

1	A parent signs in once. The product finds every student linked to that parent.
2	With one child, the dashboard opens for that child. With more than one, the parent chooses a child from "My Children".
3	The parent sees attendance, fees, receipts, results, announcements, PTM and forms for the selected child.
4	The parent can switch to another child at any time; the information changes accordingly.

Primary users: Parent.

EXAMPLE Example

My Children: Aarav — Class 8-A; Sara — Class 5-B. Selecting Sara shows Sara’s attendance, fees, results, forms and PTM information. Names are illustrative.

DESIGN PRINCIPLE UX / Design principle

Simple and mobile-friendly. The most useful things (attendance, fee status, pending forms, upcoming PTM) are visible without hunting through menus. The selected child is always clearly shown, so a parent never mistakes whose information they are viewing.

MVP LIMITATION MVP boundary

A parent can only ever see their own linked children. Whether and how report cards are shown to parents (beyond results) is a design decision to confirm.

11. PTM (Parent-Teacher Meeting)

PURPOSE
Replace manual coordination of parent-teacher meetings with clear slots that parents can book themselves.

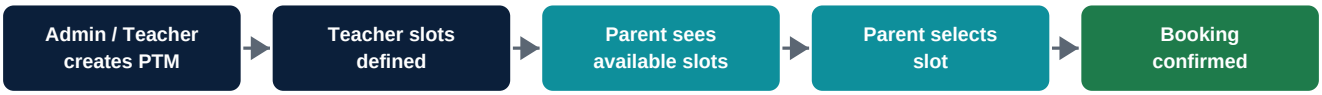

What the feature does

An admin or teacher creates a PTM with a date and defines teacher slots. Parents see the available slots and select one. The booking is confirmed.

FINALIZED MVP FEATURE Main MVP features

Create PTM Set up a parent-teacher meeting.	**Date** The date of the PTM.	**Teacher slots** Time slots for each participating teacher.
Parent slot selection Parents choose from the available slots.	**Booking confirmation** The parent and teacher see that the booking is confirmed.	

PTM WORKFLOW

How it works

1	The admin or a teacher creates a PTM and sets the date.
2	Teacher slots are defined for the PTM.
3	A parent opens PTM on the Parent Dashboard and sees the available slots.
4	The parent selects a slot for their child. The booking is confirmed.
5	The teacher sees the booked meetings, for example on the Teacher Dashboard.

Primary users: School Admin, Teacher, Parent, Principal (views).

EXAMPLE Example
A school schedules a PTM for the Class 8 teachers. Each teacher has slots; a parent books one with the Mathematics teacher. The booking appears in the child's Student 360 and on the teacher's dashboard.

DESIGN PRINCIPLE UX / Design principle
Booking should take a parent a few clear steps, with available slots obvious and the confirmed booking easy to find again.

MVP LIMITATION MVP boundary
No advanced PTM optimization and no no-show intelligence. Specific slot rules (for example how many slots a parent may book) are design decisions to confirm.

12. Basic Forms

PURPOSE
Let the school collect parent permissions, consents and acknowledgements digitally and keep the responses in one place.

What the feature does

An admin creates a form, selects the audience and publishes it. Parents respond. Each response is stored, and authorized staff can view and export responses.

FINALIZED MVP FEATURE Main MVP features

Permission forms
Ask a parent to permit something, such as a school trip.

Consent forms
Ask a parent for consent.

Event participation
Ask whether a student will take part in an event.

Acknowledgement
Ask a parent to acknowledge information.

Parent response
The parent accepts, rejects or submits a response.

FORM WORKFLOW

How it works

1	The admin creates a form of one of the supported types.
2	The admin selects the audience, for example a class or section.
3	The admin publishes the form. It appears on the Parent Dashboard of the targeted parents.
4	The parent responds. The response is stored against the student and the form.
5	Authorized staff view responses and can export them where authorized.

Primary users: School Admin, Parent, authorized staff.

EXAMPLE Example
A school publishes a field-trip permission form to Class 6. Parents accept or decline. The admin sees who has responded and who has not, and exports the responses.

DESIGN PRINCIPLE UX / Design principle
Keep it simple. A form should be quick to create and quick for a parent to answer on a phone. Pending forms should be easy to spot for parents, and easy to follow up for staff.

MVP LIMITATION MVP boundary
Basic forms only: the five types above with a simple parent response. Whether a digital response meets a particular legal or institutional requirement is for the school and legal review; the product stores the response.

PART D

Data, Dashboards and Trust

Moving data in and out, the dashboards that guide daily work, and how data is managed responsibly.

IN THIS PART

13. Import, Migration & Data Transfer
14. Data Export
15. Admin Dashboard
16. Teacher Dashboard
17. Data & Privacy
18. English-Only MVP

13. Import, Migration & Data Transfer

PURPOSE
Make it easier for a school to move its existing data into ZenCro, safely and with confidence.

What the feature does

Migration is treated as a product workflow, not a bare file upload. The admin is guided from preparation through validation, error review, preview, confirmation and reconciliation, and nothing is written to school records until the admin confirms.

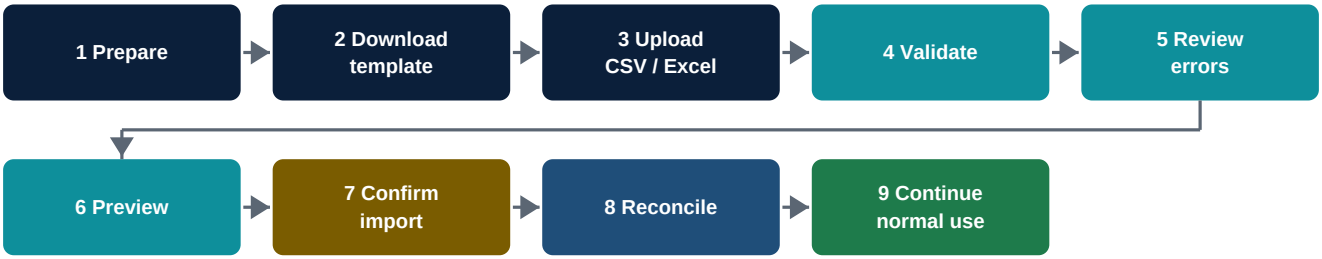

FINALIZED MVP FEATURE Finalized MVP enhancement
Data import, migration and transfer is a major finalized MVP enhancement: a guided workflow to move existing data in from Excel, CSV, previous school-management software and other structured data sources, and to move data out (Section 14).

13.1 Data sources

Source	How it is brought in
Excel	Uploaded as an Excel file prepared from the template.
CSV	Uploaded as a CSV file prepared from the template.
Previous school-management software	Data the school can export from its previous software in a structured form is prepared into the template and uploaded.
Other structured data sources	Any structured data the school can place into the template format.

13.2 The import pipeline

IMPORT PIPELINE

Step	What happens	What the admin sees
1 Prepare	The admin gathers existing data from spreadsheets or previous software.	Guidance on what data to collect.
2 Download template	The admin downloads the import template.	A template with the expected columns.
3 Upload CSV / Excel	The admin uploads the prepared file.	Upload confirmation and row count.
4 Validate	The system checks the data (required fields, duplicates and other issues).	Validation result summary.
5 Review errors	The admin reviews each problem.	A list of issues, row by row, in plain language.
6 Preview	The system shows what will be created, updated or skipped.	A preview before anything is saved.
7 Confirm import	The admin explicitly confirms.	A clear confirmation step.
8 Reconcile	The admin checks the result against the file.	Created, updated, skipped and error counts, and an import summary report.
9 Continue normal use	The imported data is part of the school's records and available to the other modules.	Imported records in normal screens.

13.3 Validation and error review

EXAMPLE: IMPORT VALIDATION RESULT

1,240 rows uploaded

1,218 valid 18 duplicates 4 missing required fields

Nothing is written to school records until the administrator confirms the import.

After validation, the admin sees how many rows are valid and what is wrong with the others. The admin can then correct the source file and upload again; validation and preview are repeated until the admin is satisfied.

ERROR-CORRECTION LOOP

> NOTE
> Valid rows and problem rows are clearly separated. Each error says which row and which field, and what is wrong, so the admin can fix the source data without guessing.

13.4 Nothing is written until the admin confirms

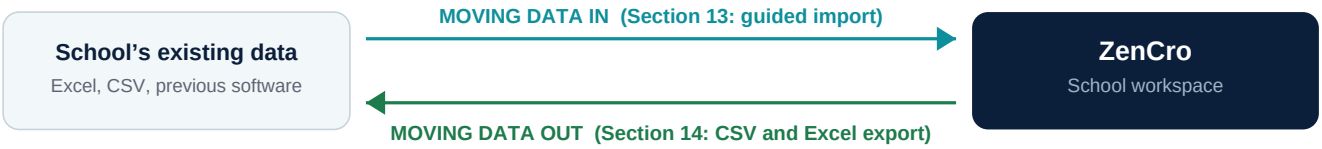

> **FINALIZED MVP FEATURE** Confirmation rule
> No import writes anything into school records until the administrator confirms it. Uploading, validating, reviewing errors and previewing change no records.

13.5 After the import

Result	Meaning
Created records	New records added to the school's data.
Updated records	Existing records changed by the import.
Skipped records	Rows intentionally not imported, for example because of an issue the admin chose not to import.
Error records	Rows that could not be imported because of problems.
Import summary / report	A record of the import so the admin can reconcile it against the source file.

13.6 Data transfer: in and out

Data transfer is the broader idea behind this module: a school's data moves into ZenCro when the school starts, and can move out of ZenCro when the school needs it.

The product supports school data ownership and portability: a school can bring its data in through a guided workflow and take it out in common formats.

Primary users: School Admin.

EXAMPLE Example

A school with a spreadsheet of students downloads the template, copies its data in, and uploads it. The result says 1,240 rows uploaded, 1,218 valid, 18 duplicates, 4 with missing required fields. The admin fixes the 22 problem rows in the spreadsheet, uploads again, reviews the preview, and confirms. Numbers are illustrative.

DESIGN PRINCIPLE UX / Design principle

The admin should always know where they are in the process, what is wrong and how to fix it, and should never fear that something has already been saved by mistake.

MVP LIMITATION MVP boundary

The MVP does not promise automatic migration from every ERP or school-management product. It provides a guided import from structured files. Which record types the import supports at launch is a design detail to confirm.

14. Data Export

PURPOSE
Let the school take its data out of ZenCro in common formats, under proper control.

What the feature does

The admin can export students, attendance, fees, results, and forms where authorized. Exports are available as CSV or Excel. Exports are permission-controlled and logged.

FINALIZED MVP FEATURE Main MVP features

Students Export student records.	**Attendance** Export attendance records.	**Fees** Export fee records.
Results Export results.	**Forms (where authorized)** Export form responses where the user is authorized.	**CSV and Excel** The two supported export formats.

Control	What it means
Permission-controlled	Only users with the right permission can export a given type of data.
Logged	Each export is recorded, so the school can see who exported what and when.
Subject to access permissions	A user can export only data they are allowed to access.

EXPORT FLOW

How it works

1. An authorized user chooses the data to export: students, attendance, fees, results, or forms where authorized.
2. The user chooses CSV or Excel.
3. The product checks that the user has permission and generates the file.
4. The export is recorded in the activity information (Section 17).

EXAMPLE Example
The admin exports all students to Excel, and the accountant exports fee records to CSV for the school's own records.

DESIGN PRINCIPLE UX / Design principle
Export should be easy to find (including from the Admin Dashboard Quick Actions and relevant screens) and unambiguous about what is being exported.

MVP LIMITATION MVP boundary
CSV and Excel only. No other export formats in the MVP.

15. Admin Dashboard

PURPOSE
Show the administrator what is happening in the school and what needs action today, without a wall of statistics.

What the feature does

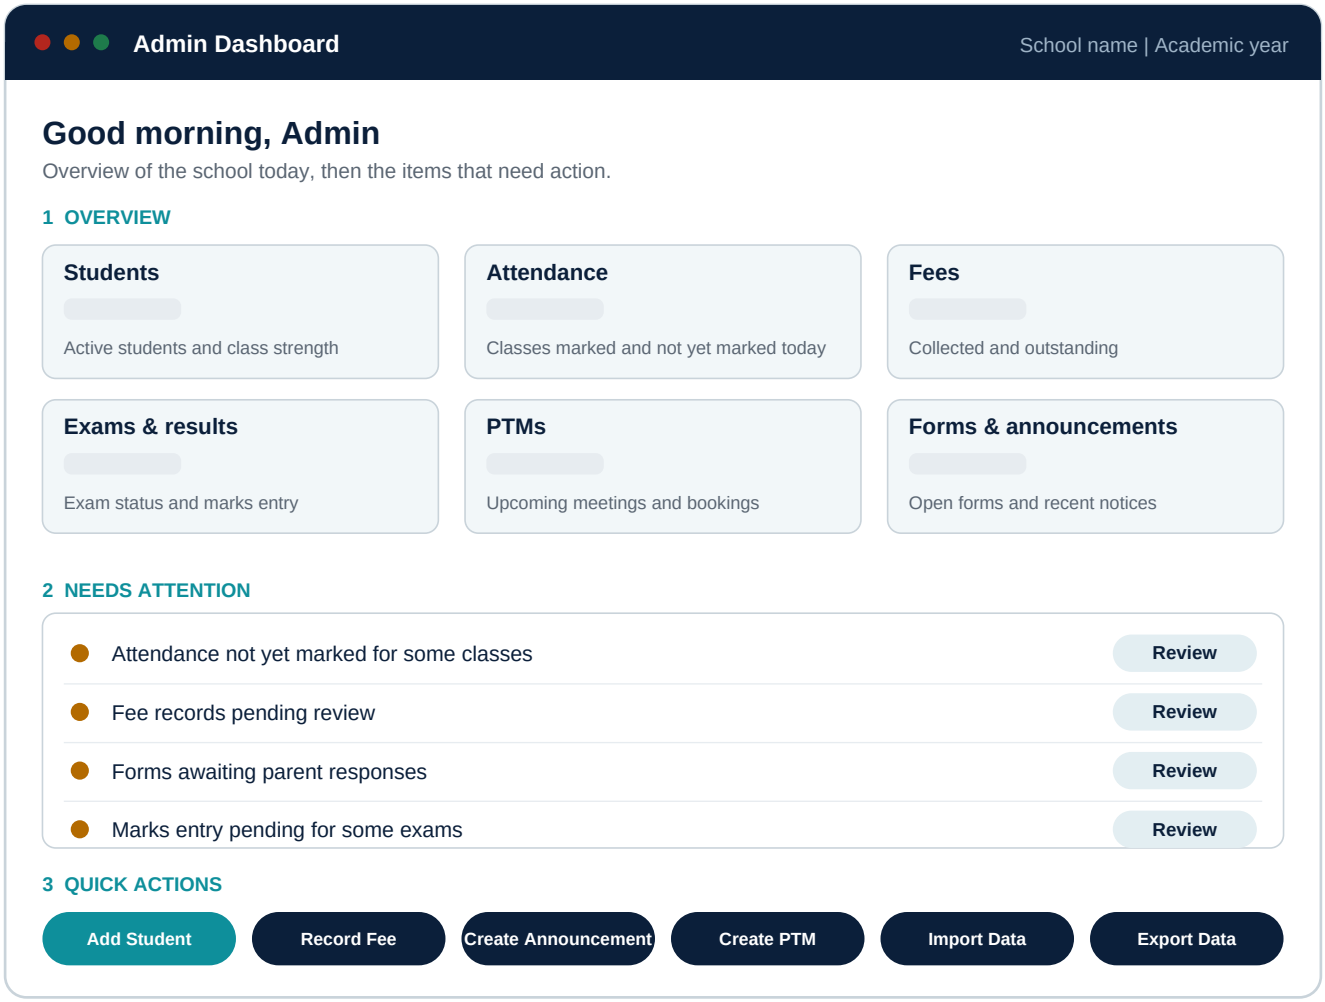

The Admin Dashboard has three parts in a clear order: an Overview of the school, a Needs Attention list of actionable items, and Quick Actions for the most common tasks.

DESIGN PRINCIPLE Core design principle
Action-oriented, simple and pleasing. The dashboard answers "what needs my attention?" first and "what do I want to do?" next. It avoids clutter and unnecessary charts.

DASHBOARD STRUCTURE

15.1 Concept wireframe

EXAMPLE The wireframe shows structure and hierarchy, not final visual design or data.

15.2 Overview

FINALIZED MVP FEATURE Main MVP features

Students
The student base at a glance.

Attendance
Where attendance stands today.

Fee collection / outstanding
What has been collected and what is outstanding.

Exams / results
Status of examinations and marks entry.

PTMs
Upcoming PTMs and bookings.

Forms / announcements
Open forms and recent announcements, where relevant.

15.3 Needs Attention / action queue

Needs Attention lists items that require action. Each item opens the relevant records so the admin can act. Items are based on deterministic data and rules; no AI or prediction is used.

Needs Attention item (example)	Based on (deterministic rule, example)	Leads to
Missing attendance	A class has no attendance recorded for the day	Attendance for that class
Pending fee review	Fee records marked as needing review	The relevant fee records
Pending forms	Parents who have not yet responded to a published form	The form and its responses
Pending marks	An examination with marks not yet entered	The examination and marks status
Other actionable MVP items	Any similar rule-based item within MVP modules	The relevant records

MVP LIMITATION MVP boundary

The list above gives examples of the kinds of items. The exact set of rules is a design detail within MVP modules. Needs Attention does not predict, score or recommend using AI.

15.4 Quick Actions

Quick Action (example)	Goes to
Add Student	Student Management
Record Fee	Fees Management
Create Announcement	Communication
Create PTM	PTM
Import Data	Import, Migration & Data Transfer
Export Data	Data Export

15.5 UI principles

Clean
Minimal clutter; one idea per card.

Clear hierarchy
Overview, then Needs Attention, then Quick Actions.

Readable
Comfortable type and spacing.

Meaningful cards
Each card says what it is and why it matters.

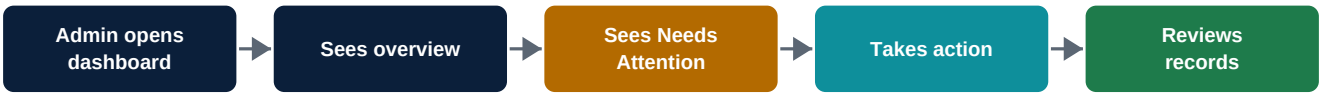

Obvious primary actions
The next step is always clear.

Responsive
Works on desktop and smaller screens.

Pleasing
Calm, professional visual design.

Few charts
Avoid unnecessary charts.

TYPICAL USE

Primary users: School Admin.

16. Teacher Dashboard

PURPOSE
Answer one question for the teacher the moment they sign in: what do I need to do today?

What the feature does

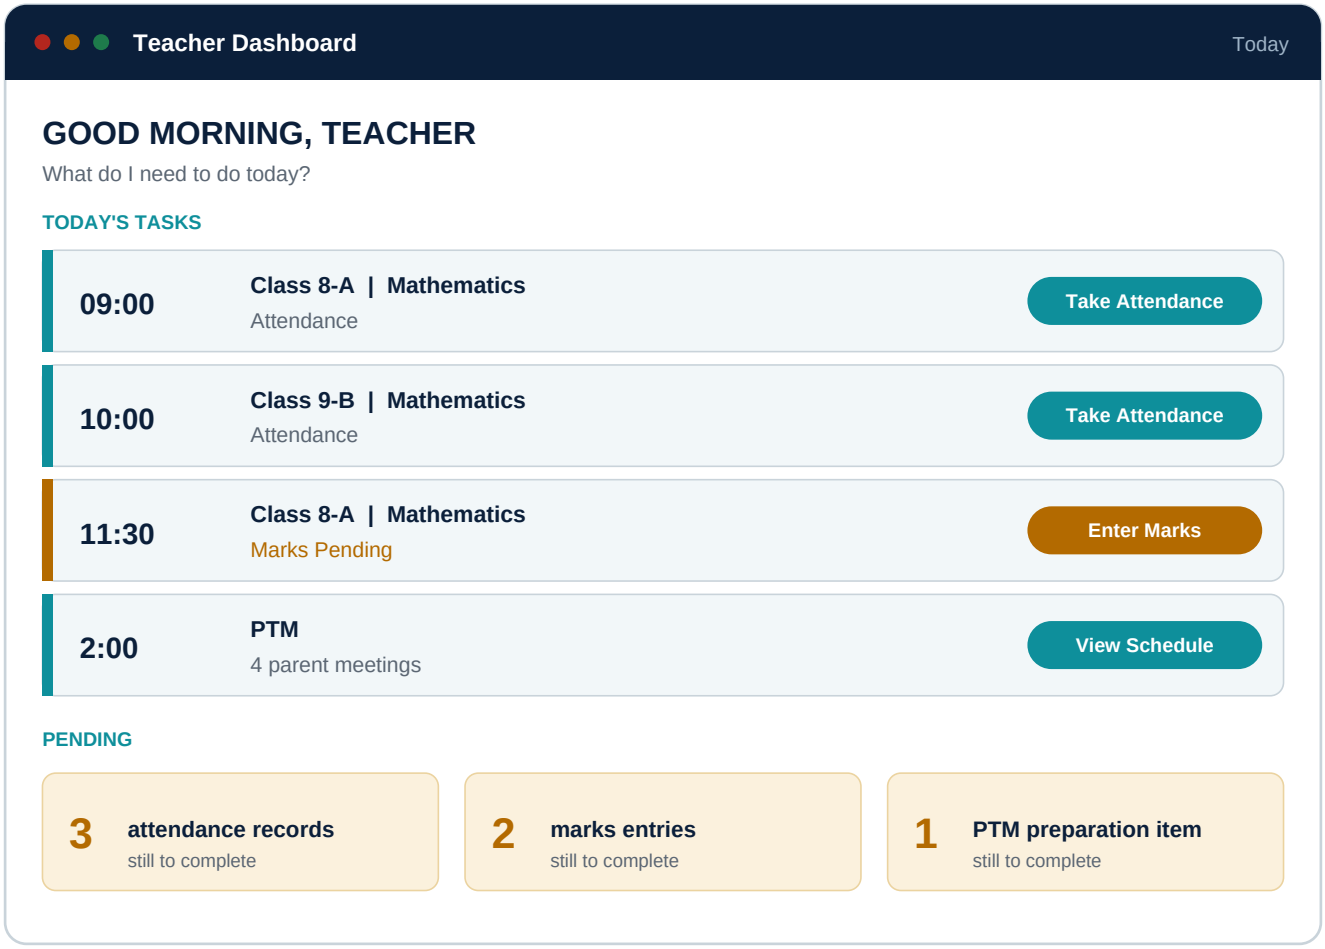

The Teacher Dashboard shows today's tasks, with a direct action for each, and a list of pending work.

DESIGN PRINCIPLE Core design principle
TODAY + TASKS + PENDING WORK. The dashboard is organized around the teacher's day, not around the product's modules.

DASHBOARD STRUCTURE

16.1 Concept UI

EXAMPLE Times, classes and counts are illustrative.

16.2 What the dashboard shows

Part	What it contains	Action offered
Today	A greeting and the day's items in time order.	-
Tasks	Class attendance to take; marks to enter; PTM meetings for the day.	Take Attendance, Enter Marks, View Schedule
Pending	Attendance records not yet taken, marks entries not yet completed, PTM preparation items.	Opens the relevant item

EXAMPLE Example: Today's Tasks

- 09:00 Class 8-A Mathematics Attendance [Take Attendance]
- 10:00 Class 9-B Mathematics Attendance [Take Attendance]
- 11:30 Class 8-A Mathematics Marks Pending [Enter Marks]
- 2:00 PTM 4 parent meetings [View Schedule]
- Pending: 3 attendance records, 2 marks entries, 1 PTM preparation item

TYPICAL USE

Primary users: Teacher.

DESIGN PRINCIPLE UX / Design principle

Every task has one clear button that takes the teacher directly to the action. Pending work is visible without searching, and finishing a task removes it.

MVP LIMITATION MVP boundary

No advanced timetable, homework, LMS or teacher analytics suite. How the dashboard knows a teacher's classes and times for the day is a design decision to confirm (for example a simple teacher-class assignment); it does not require an advanced timetable engine.

17. Data & Privacy

PURPOSE
Give authorized administrators a clear place to see and manage how the school's data is accessed, exported and handled, and to find privacy information.

What the feature does

Data & Privacy brings together the administrator-facing areas related to data: who has access to what, exporting data, managing data, privacy information, retention configuration or process where applicable, activity/audit information, and school data ownership and portability information. It is available to authorized administrators.

FINALIZED MVP FEATURE Main MVP features

Data access
Information on who can access what within the school.

Data export
Access to data export (Section 14).

Data management
Administrator-level management of the school's data.

Privacy information
Practical privacy information for the school.

Data retention
Retention configuration or process where applicable.

Activity / audit information
A record of important activity, including exports.

Ownership and portability information
Plain information that the data belongs to the school and how it can be moved out.

How it works

1. An authorized administrator opens Data & Privacy.
2. They review who has access, and the activity information for important actions.
3. They use data export and data management areas as permitted.
4. They read the privacy and ownership information relevant to their school.

Primary users: Authorized administrators.

17.1 Position on privacy and compliance

DESIGN PRINCIPLE Practical, not legalistic

- The architecture should support appropriate security and privacy controls, such as access restricted by role and each school's data kept within its own workspace.
- Compliance with data protection requirements depends on product, operational and legal processes, and those requirements need ongoing review.
- ZenCro is not described in this document as automatically compliant with any data protection law. Data & Privacy provides practical tools and information; it is not a statement of legal compliance.

EXAMPLE Example
An administrator wants to know who exported student data last month. In Data & Privacy they open the activity information and see the export entries. Illustration only.

DESIGN PRINCIPLE UX / Design principle
Plain language and clear structure. An administrator who is not a lawyer or a technologist should understand what each area is for.

MVP LIMITATION MVP boundary
The depth of each area (for example exactly what activity is recorded, and which retention options exist) is a design detail to confirm within the MVP. No claim of legal compliance is made.

18. English-Only MVP

MVP LANGUAGE: ENGLISH

The MVP interface, labels, dashboards and workflows are designed in English. Every screen, message, template and report in this document assumes English.

FINALIZED MVP FEATURE Finalized MVP feature

English is the MVP language for all interface text, labels, dashboards and workflows.

MVP LIMITATION MVP boundary

No multilingual functionality in the MVP: no language switching and no translated interface. Content entered by the school (such as names or announcement text) is stored as entered.

PART E

Experience, Journeys and Scope

How the modules work together as one system, end-to-end user journeys, the full feature summary, and what is not part of this MVP.

IN THIS PART

19. Cross-Module User Experience
20. MVP User Journeys
21. MVP Feature Summary
22. What Is Not Part of This MVP
23. Final MVP Blueprint

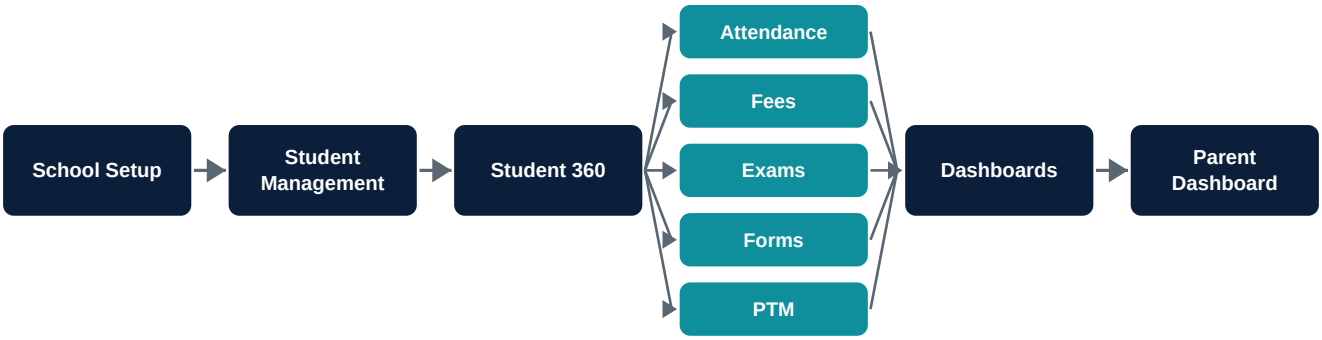

19. Cross-Module User Experience

The MVP should feel like one connected system, not fourteen disconnected modules. Information is entered once and appears wherever it is needed.

DESIGN PRINCIPLE Design principle
One connected system: enter once, use everywhere. A student added once appears in attendance, fees, exams, forms, PTM, dashboards and the parent view.

19.1 Flow 1: from setup to dashboards

FLOW 1

School Setup defines the structure. Student Management holds the students. Student 360 gathers each student's information. Attendance, fees, exams, forms and PTM generate activity. Dashboards summarize it for staff, and the Parent Dashboard shows each parent their own child.

19.2 Flow 2: import into the system

FLOW 2

Imported student and school data becomes ordinary data in the system, so attendance, fees, exams, forms, PTM and dashboards work on it without any further steps.

19.3 Flow 3: from exams to report cards

FLOW 3

19.4 Flow 4: from fees to the admin dashboard

FLOW 4

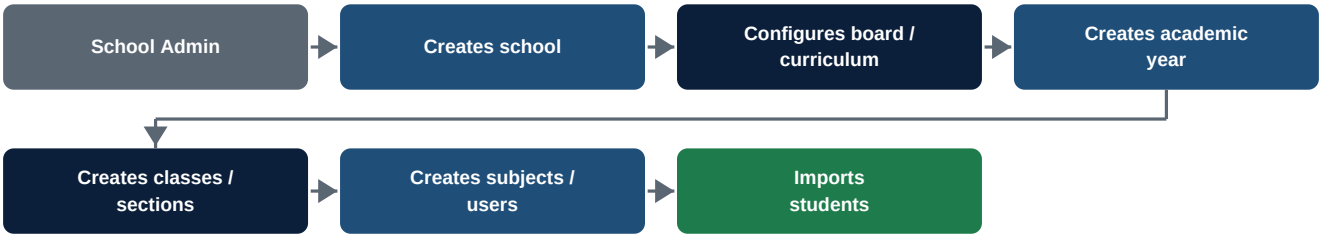

19.5 Where information appears

Information entered in	Also appears in
School Setup (classes, sections, subjects)	Student records, attendance, fees, exams, announcements audiences, report-card configuration
Student Management	Student 360, attendance, fees, results, forms, PTM, Parent Dashboard
Attendance	Student 360, Parent Dashboard, Admin Dashboard (missing attendance), Teacher Dashboard (tasks), export
Fees (payments, receipts)	Student 360, Parent Dashboard, Admin Dashboard (collection and outstanding), export
Exams & Results (marks)	Student 360, Parent Dashboard, report cards, Admin and Teacher Dashboards (pending marks), export
Announcements	Parent Dashboard and staff views, Admin Dashboard
PTM bookings	Student 360, Parent Dashboard, Teacher Dashboard
Forms and responses	Student 360, Parent Dashboard, Admin Dashboard (pending forms), export where authorized
Import	All modules that use the imported data
All activity	Data & Privacy (activity/audit information)

20. MVP User Journeys

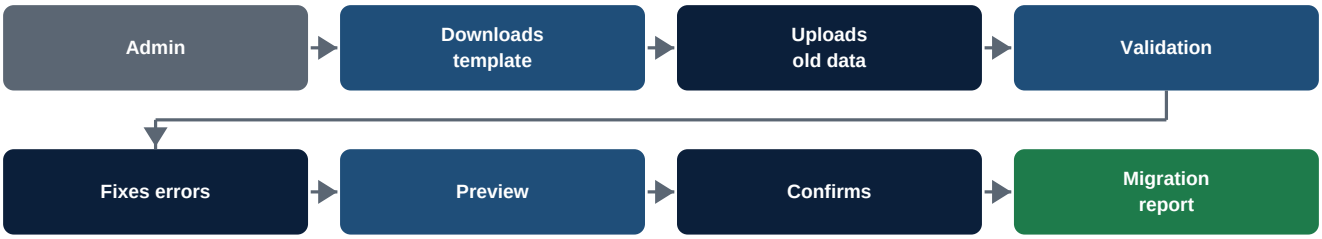

Seven practical journeys show how the modules combine in real use. Each is an illustration of intended use.

Journey 1: New school setup

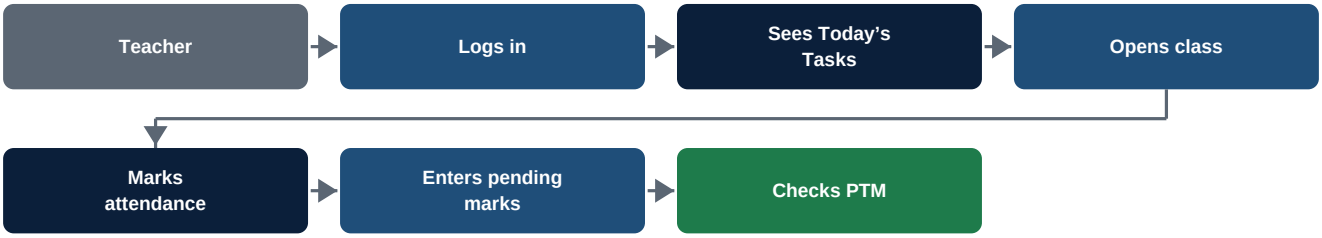

Outcome: The school is ready for daily use: structure in place, students loaded.

Journey 2: Student migration

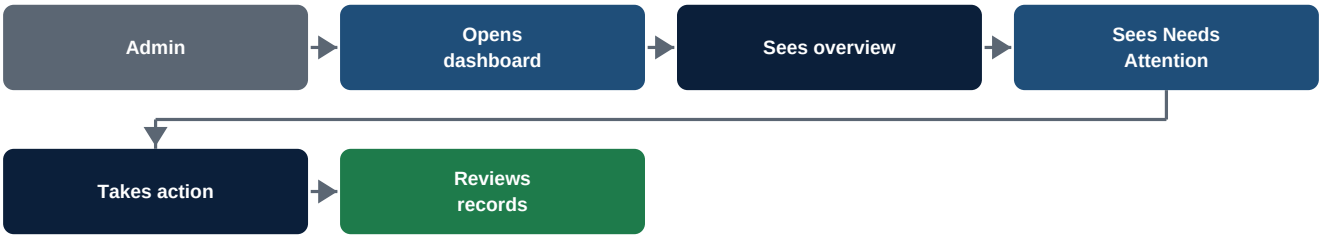

Outcome: Existing student data is in ZenCro, with a report to reconcile against the source.

Journey 3: Teacher daily work

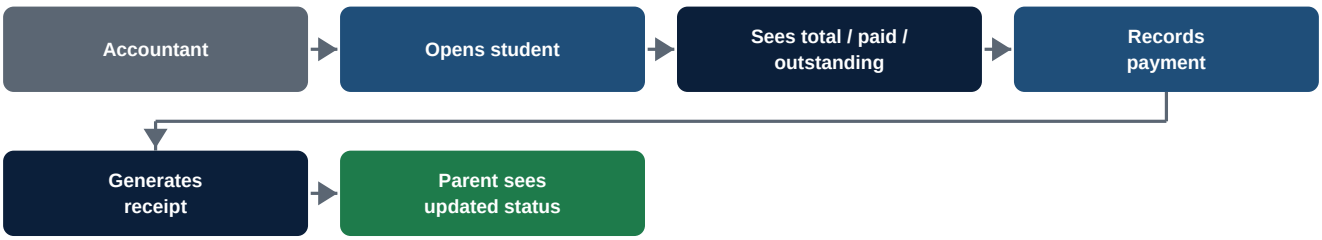

Outcome: The teacher's day is organized around tasks, and pending work is cleared.

Journey 4: Admin monitoring

Outcome: The admin spots and resolves items that need action.

Journey 5: Fee payment

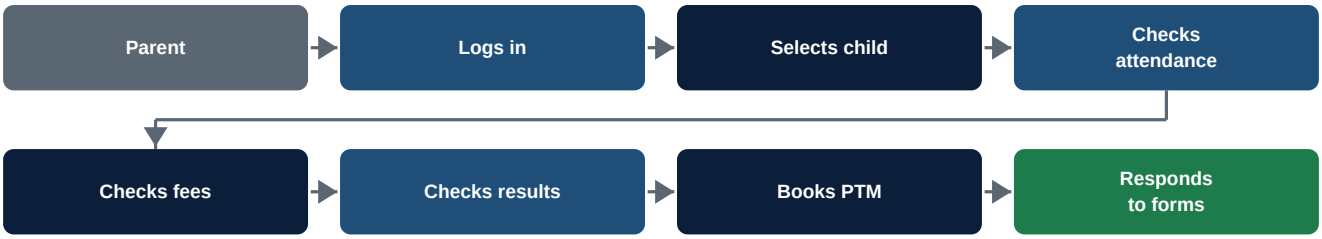

Outcome: The payment is recorded, the receipt exists and the parent sees the new status.

Journey 6: Report card

Outcome: The report card is produced from the class's profile and template.

Journey 7: Parent

Outcome: The parent gets what they need for their child in one session.

21. MVP Feature Summary

Every finalized MVP feature, by module. This table contains only features included in the first-stage MVP.

Module	MVP feature	Primary users	Main purpose
1. School Setup	School name, logo, address / contact	School Admin	Establish the school's identity
	Academic year	School Admin	Define the academic period
	Board / curriculum information	School Admin	Guide report-card configuration
	Classes, sections, subjects	School Admin	Define the academic structure
	Users, roles, permissions	School Admin	Control who can do what
2. Student Management	Student record (ID, name, DOB, gender, class, section, guardian, contact, status, basic documents)	School Admin, Principal, Teacher (scope)	Hold one accurate record per student
	Student 360 (overview, info, guardian, class/section, attendance, fees, results, forms, PTM, activity timeline)	Admin, Principal, Teacher (scope), Accountant (fees), Parent (own child)	Show a student's information in one view
3. Attendance	Daily class / section attendance entry (Mark All Present, change exceptions)	Teacher	Minimize teacher effort
	Edit / correction workflow	Teacher, School Admin	Fix wrong entries
	Attendance percentage and basic reports	School Admin, Principal, Teacher	Make attendance useful
	Parent visibility and basic notification	Parent	Keep parents informed
	Selected / basic offline capture (if technically validated)	Teacher	Continue when connectivity is poor
4. Fees	Fee categories, structures, assignment	Accountant, School Admin	Define and apply fees
	Student dues, full and partial payment, payment recording	Accountant, School Admin	Track what is owed and paid
	Receipts	Accountant, Parent	Evidence of payment
	Outstanding amount and collection reports	Accountant, School Admin, Principal	See status and collections
	Basic reconciliation	Accountant	Confirm dues, payments and receipts agree
	Parent fee visibility	Parent	Clear fee status for parents
5. Exams & Results	Create examinations, define subjects	School Admin	Set up assessment
	Enter marks	Teacher	Record results
	Grading and results	School Admin, Teacher, Principal, Parent	Turn marks into results
	Configurable report cards: board/curriculum, academic-level profiles, class assignment, assessment types, bounded templates, preview, generation	School Admin (configure, generate)	Produce suitable report cards for each level
6. Communication	Announcements with audience targeting (all parents, class, section, teachers, students where appropriate)	School Admin, Principal	Reach the right people
	Publish and view announcements	All roles (view)	Share and read notices
7. Parent Dashboard	Child profile, attendance, fees, receipts, results, announcements, PTM, forms	Parent	One simple parent view
	Multi-child switching	Parent	Several children, one account
8. PTM	Create PTM, date, teacher slots	School Admin, Teacher	Set up meetings
	Parent slot selection and booking confirmation	Parent	Let parents book themselves

Module	MVP feature	Primary users	Main purpose
9. Basic Forms	Permission, consent, event participation, acknowledgement forms	School Admin	Collect digital responses
	Parent response; staff view / export	Parent; authorized staff	Store and use responses
10. Import, Migration & Data Transfer	Prepare, download template, upload CSV / Excel	School Admin	Start a guided import
	Validate, review errors, correct and re-upload, preview	School Admin	Fix problems before saving
	Confirm import (nothing saved before confirmation)	School Admin	Control what is written
	Reconcile: created, updated, skipped, error records; import summary	School Admin	Verify the result
	Data transfer in and out	School Admin	Data ownership and portability
11. Data Export	Export students, attendance, fees, results, forms where authorized	School Admin; Accountant (fees)	Take data out
	CSV and Excel; permission-controlled; logged	School Admin	Controlled, traceable export
12. Admin Dashboard	Overview	School Admin	See the school at a glance
	Needs Attention (rule-based action queue)	School Admin	Find what needs action
	Quick Actions	School Admin	Do common tasks quickly
13. Teacher Dashboard	Today and Tasks (with direct actions)	Teacher	Show what to do today
	Pending work	Teacher	Show what is unfinished
14. Data & Privacy	Data access, data export, data management	Authorized administrators	Administrator control of data
	Privacy information, retention configuration/process where applicable	Authorized administrators	Practical privacy information
	Activity / audit information; ownership and portability information	Authorized administrators	Traceability and data ownership
English-only MVP	English interface, labels, dashboards and workflows	All roles	Single MVP language

22. What Is Not Part of This MVP

> **NOTE**
> "Not part of MVP" means not included in the first-stage scope. It does not mean the functionality can never exist in the future.

Transport Not part of this MVP	**Library** Not part of this MVP	**Hostel** Not part of this MVP
HR / payroll Not part of this MVP	**Staff leave** Not part of this MVP	**Advanced timetable** Not part of this MVP
Full LMS Not part of this MVP	**Homework management** Not part of this MVP	**Advanced admissions CRM** Not part of this MVP
Inventory Not part of this MVP	**School accounting** Not part of this MVP	**Advanced multi-campus** Not part of this MVP
AI chatbot Not part of this MVP	**Predictive analytics** Not part of this MVP	**Native mobile apps** Not part of this MVP
Multilingual support Not part of this MVP	**Advanced board-specific automation** Not part of this MVP	

This list contains only the areas explicitly excluded from the first-stage scope. If a capability is not in the fourteen functional areas, it is not part of the MVP, whether or not it appears on this list.

23. Final MVP Blueprint

The finalized MVP is a focused, connected K–12 school management platform.

The MVP consists of fourteen functional areas that work together: a School Setup that gives each school its own workspace; Student Management with Student 360; fast Attendance; clear Fees; Exams & Results with a bounded, configurable report-card system; Communication; a mobile-friendly Parent Dashboard with multi-child support; PTM; Basic Forms; a guided Import, Migration & Data Transfer workflow; Data Export; an action-oriented Admin Dashboard; a Today-and-Tasks Teacher Dashboard; and Data & Privacy. The MVP interface is in English.

The product differentiates through better execution of common school-management workflows: workflows that are simpler, clearer, more useful and easier to operate, and data that is easy to bring in and take out.

23.1 MVP boundary recap

Included	Not included
The fourteen functional areas in this document Student 360 and multi-child parent view Configurable report cards (board/curriculum + academic level + bounded template) Guided import with confirmation, and CSV / Excel export Action-oriented Admin Dashboard and Today-focused Teacher Dashboard English interface	Everything listed in Section 22 Free-form report-card designer Automatic implementation of every board's rules Automatic migration from every ERP AI-based predictions Any claim of automatic legal compliance

23.2 Design decisions to confirm

The following details were deliberately not fixed by the finalized MVP scope. They should be settled during design and recorded, without expanding the scope.

Area	Decision to confirm
Attendance	Exception statuses beyond Absent; who may correct which entries; whether offline capture is validated.
Student records	Student status values; the list of basic documents.
Teacher Dashboard	How a teacher's classes and times for the day are defined, without an advanced timetable engine.
Report cards	Whether and how report cards are shown to parents; the bounded set of template options.
Communication	Which roles may publish announcements by default.
Fees	The exact reconciliation views.
Import	Which record types the import supports at launch.
Data & Privacy	The depth of activity information and retention options.
PTM	Slot rules such as how many slots a parent may book.

DESIGN PRINCIPLE Closing principle

Build the connected core well. Every addition should be judged against the MVP principles: simplicity, clarity, reduced administrative effort and reliable workflows.
